

Good morning/afternoon.

I'm Nawash Shariff Thippusulthan, a Python Backend Developer and Data Engineer based in Chennai, India, with over 3 years of professional experience at Accenture.

Throughout my career, I have worked across backend application development, API development, data processing, and data engineering solutions. My core strengths include Python, Django, FastAPI, SQL, Pandas, ETL development, and cloud-based data platforms.

At Accenture, I worked on three major enterprise projects serving global clients.

1. Internal Document Automation Platform — Python/Django Backend Developer (Nov 2021 – Mar 2023)

I began my career as a Django Backend Developer working on an enterprise document automation platform designed to eliminate manual document preparation processes.

The application allowed business users to upload Excel files through a web interface and automatically generate standardized business documents based on predefined templates.

My primary responsibility was developing backend functionality using Django and Python. I worked extensively with OpenPyXL and Pandas to process uploaded Excel files, perform data validation, cleansing, transformation, and business-rule implementation.

Once the required data was extracted and transformed, the system automatically populated predefined Word document templates and generated completed documents for end users. This significantly reduced manual effort and improved data accuracy.

I also worked on Django Admin customizations, database model enhancements, application feature development, bug fixes, and production support activities. Additionally, I collaborated closely with business analysts and end users to understand document generation requirements and convert manual workflows into automated solutions.

Technology Stack: Python, Django, Pandas, OpenPyXL, SQL, Django Admin, Git.

2. Alexion / AstraZeneca — Python & Data Engineer (Mar 2023 – Jun 2024)

After gaining experience in backend development, I transitioned into a Data Engineering role where I worked on designing and maintaining scalable ETL pipelines and data processing workflows.

My responsibilities included developing Apache Airflow DAGs for workflow orchestration, building data transformation pipelines using Python and Pandas, implementing DBT models, and managing data movement across Snowflake and AWS services such as S3 and EMR.

I was also involved in developing FastAPI endpoints that enabled secure and structured access to processed business data. In addition, I implemented monitoring, logging, error handling, and alerting mechanisms to improve pipeline reliability and maintainability.

This role helped me strengthen my expertise in large-scale data processing, workflow automation, and cloud-native architectures.

Technology Stack: Python, Apache Airflow, DBT, Snowflake, AWS S3, AWS EMR, FastAPI, SQL.

3. Thermo Fisher Scientific — Data Engineer (Jun 2024 – Aug 2024)

In this project, I focused on large-scale data engineering solutions involving PySpark and AWS Glue.

My responsibilities included developing scalable ETL pipelines, processing large datasets, integrating AWS S3-based storage solutions, implementing data quality validations, and optimizing workflow performance.

I also worked on monitoring and troubleshooting production pipelines to ensure data consistency, reliability, and efficient processing of business-critical datasets.

Technology Stack: PySpark, AWS Glue, AWS S3, Python, SQL.

Personal Project — Stelvio

Alongside my professional work, I have been building a backend API project called Stelvio using FastAPI and SQLAlchemy.

The project focuses on designing production-grade REST APIs, implementing relational database modeling, session management, authentication mechanisms, and Alembic-based database migrations. Through this project, I have gained deeper hands-on experience in API design principles, clean architecture, ORM concepts, and backend best practices.

I hold a Bachelor of Engineering in Electrical and Electronics Engineering from Anna University, Chennai.

Overall, my experience spans Django application development, backend API development using FastAPI, data processing with Python and Pandas, and enterprise-scale data engineering solutions. I enjoy working in Agile environments, collaborating with cross-functional teams, and building reliable, scalable, and maintainable software systems.

I am now looking forward to leveraging my backend development and Python expertise to contribute effectively to a challenging role at Infosys.
